World leaders in process control.

In control

Our competence is the development and production of mechanical and electronic instruments for measuring temperature, pressure and relative humidity. We know our clients' markets, we understand their business and share their ambitions. This is our inspiration to be the leading authority in controlled environments. Thanks to VDH you are in control of your business.

A passion for accuracy

VDH is the first choice for accurate measurements in all cases where temperature, pressure and relative humidity are crucial aspects. Our mechanical and electronic instruments are supplied to customers in many sectors all over the world. Whether you operate in the food industry, the transport sector or process engineering, with VDH you opt for top quality measuring instruments and control systems. Moreover, we know your market, we are aware of the dynamics and the technological challenges. Our know-how enables us to advise you on the right instruments, systems and components for complete precision and reliability.

Reliability. Durability

In any environment, why settle for less?

From spray booth to vegetable storage and from polymer factory to assembly line: precision is required in the environmental conditions for all production processes. All deviations in temperature, pressure and relative humidity can have far-reaching implications. So why take a risk when it comes to the reliability of your measuring instruments? We stand out for our uncompromising quality. Our instruments are designed and built for optimum performance. Year in, year out, under heavy-duty conditions.

No-nonsense

Why complexity if all you need is total, intuitive control?

The more complex the environmental conditions, the greater the need for effective instruments will be. After all, the continuity of the production process comes first, not the regulation of peripheral conditions such as temperature, pressure and relative humidity. That is why we take user-friendliness so seriously. Technology is certainly our passion, but we focus even more on the people behind it. On the end-user. VDH instruments are therefore acclaimed throughout the industry for their logical operation, simplicity and intuitiveness.

Unparalleled quality

VDH started life as a manufacturer of top quality mechanical pressure gauges, thermometers and hygrometers. These days we are an authority in hi-tech measuring instruments and systems. We keep our development and production strictly under our own management. Why? Because we make no concessions to reliability and durability. That's why we devote just as much attention to a 'simple' thermometer as to a sensor, timer, interface or complete control unit for a specific application, such as fruit ripening.

Opting for VDH means opting for unparalleled quality. And that ultimately determines your competitive advantage.

The beauty of simplicity

VDH is a technologically advanced company. But even though today's technology knows no limits, we have always set out to provide non-nonsense solutions. Simplicity is the great challenge faced by our engineers. Using modern systems and software, they develop instruments that do what they're supposed to do: perform. VDH meters, sensors and control systems give you all the efficiency you need. Technology without unnecessary functionality, tailored to the end-user, down to the finest details. It's that simple.

VDH supplies measuring instruments for

- Cooling and climate technology
- Agriculture and horticulture
- Transport cooling
- Spray booths
- Fruit ripening, storage and preservation
- Bakery technology
- Process control technology and instrument building
- Heating and ventilation technology

Standard parts, tailor-made solutions

At VDH virtually nothing is impossible. As the leader in temperature, pressure, and relative humidity we offer a large range of gauges, sensors, control systems and accessories. Although many components, semi-manufactures and standard end-products are available off-the-shelf from our warehouse, our strength lies in developing tailor-made solutions. Our know-how and advanced R&D facilities make us the ideal partner for all conceivable measuring instruments and regulating systems for controlled environments.
